

## TLC's Trace Explorer

You should have the TLC Errors window containing the error trace open in the Toolbox. If not, raise it again by running TLC to check the invariance of  $pc[1] = \text{“c1”}$ . Right above the Error-Trace section is a section labeled Error-Trace Exploration. Open it (click on the  $\oplus$ ) and add the expression  $p \oplus c$ , which equals  $\bar{b}$ . Click on the Explore button. TLC will now display the value of  $p \oplus c$  for each state of the error trace.
