

Another reason I used labels  $p1$  and  $c1$  instead of  $p$  and  $c$  was to avoid the name clash with the variables  $p$  and  $c$ . This clash would have caused the PlusCal translation to be the same as if the labels had been changed from  $p$  and  $c$  to  $p_$  and  $c_$ . It's generally a good idea to avoid any kind of name clash in PlusCal code because it causes names to be changed in the TLA<sup>+</sup> translation, which makes it harder to see the relation between the PlusCal code and the translation.
