There is a *Reals* module that defines ordinary division, but it is rarely used because the TLC model checker cannot evaluate the operator /. So, we define *Divides* using the operators defined in the *Integers* module.

The *Integers* module is about integers, and n/p is not, in general, an integer. The only arithmetic operations you learned in grade school that the module defines are addition (+), subtraction (−), multiplication (*), and exponentiation (a^b is typed `a^b`). There is a *Reals* module that defines ordinary division, but it is rarely used because the TLC model checker cannot evaluate the operator /. So, we define *Divides* using the operators defined in the *Integers* module.
