

Well-Founded Relations

An operator \succ is called a *partial order* on a set \mathcal{N} iff it satisfies the following two conditions:

Irreflexivity $\forall n \in \mathcal{N} : \neg(n \succ n)$

Transitivity $\forall m, n, p \in \mathcal{N} : (m \succ n) \wedge (n \succ p) \Rightarrow (m \succ p)$

A partial order \succ on \mathcal{N} is called a *total order* iff it also satisfies the condition:

Completeness $\forall m, n \in \mathcal{N} : (m \succ n) \vee (n \succ m) \vee (m = n)$

A partial order \succ on a set \mathcal{N} is said to be *well-founded* iff there is no infinite descending chain of the form:

$$n_1 \succ n_2 \succ n_3 \succ \dots$$

with all the n_i in \mathcal{N} . This condition can be expressed formally in terms of [functions](#)[□] as

$$\neg \exists f \in [Nat \rightarrow \mathcal{N}] : \forall i \in Nat : f[i] \succ f[i+1]$$

Any partial order on a finite set is obviously well-founded. The relation $>$ is a well-founded total order on the set Nat of natural numbers. A well-founded partial (or total) order \succ on a set \mathcal{N} is also a well-founded partial (or total) order on any subset of \mathcal{N} .

A useful well-founded total order is the relation \succ_k on k -tuples of natural numbers, defined by letting

$$\langle a_1, \dots, a_k \rangle \succ_k \langle b_1, \dots, b_k \rangle$$

iff there exists i in $1..k$ such that $a_i > b_i$ and $a_j = b_j$ for all j in $1..(i-1)$. Since [a \$k\$ -tuple of natural numbers is a function](#)[□] from $1..k$ to Nat , this definition can be written formally as

$$\begin{aligned} a \succ_k b &\triangleq \wedge a \in [1..k \rightarrow Nat] \\ &\wedge b \in [1..k \rightarrow Nat] \\ &\wedge \exists i \in 1..k : \wedge a[i] > b[i] \\ &\wedge \forall j \in 1..(i-1) : a[j] > b[j] \end{aligned}$$

(This isn't a TLA^+ definition because we can't write \succ_k in TLA^+ ; we would have to define the operator for a particular value of n .)

We can generalize these relations \succ_k to the well-founded total order \succ on the set of all finite sequences of natural numbers by defining $m \succ n$ to be true iff either (i) sequence m is longer than sequence n or (ii) they both have length k and $m \succ_k n$. The TLA^+ definition of \succ is easily written using the operators *Seq* and *Len* defined in the [standard Sequences module](#)[□].
