

A Toolbox Pretty-Printing Bug

If you are using Adobe Reader and a Windows 64-bit operating system, the pretty-printed version may appear in a separate window outside the Toolbox. If that happens, you will have to delete that window before you can run the Produce PDF Version again on the same module.

To prevent this behavior, select the Use built-in PDF viewer option of the PDF Viewer page in the *Preferences* window. To find that page, click on Preferences in the Toolbox's File menu. This will raise the *Preferences* window, in which you should select TLA+ Preferences / PDF Viewer.
