

A Proof of GCD3

1. It suffices to assume that m and n are positive integers and d is any integers, and to prove that d divides both m and n iff d divides both m and $n - m$.

PROOF: Since the gcd of two numbers is the largest integer that divides both of them, it suffices to show that m and n have the same common divisors as m and $n - m$.

2. If d divides both m and n , then d divides both m and $n - m$.

PROOF: That d divides m follows from the assumptions; that it divides $n - m$ follows from the assumptions and Lemma Div.

3. If d divides both m and $n - m$, then d divides both m and n .

PROOF: That d divides m follows from the assumptions; that it divides n follows from the assumptions, Lemma Div, and the simple algebraic relation: $n = m + (n - m)$.

4. Q.E.D.

PROOF: GCD3 follows from steps 1, 2, and 3.
